```

A.9 MISCELLANEOUS

Example1

This example shows how to allocate, and deallocate memory.

Example2

This example shows how to allocate and deallocate memory with help of the functions AllocRemember(), and FreeRemember().

```
/\,\star\, Do whatever you want to do with the memory. ^{\star}/
                                                                                                                                                                                                        /* Deallocate all memory with one single call: */ FreeRemember( &remember, TRUE );

break;
```

Example5

This example prints out the current time.

A.10 SPRITES

Example1

This program shows how to declare and initialize some sprite data and a SimpleSprite structure. It also shows how to reserve a sprite (sprite 2), and how to move it around. The user moves the sprite by pressing the arrow keys.

```

Example2

This program shows how to declare and initialize some sprite data and a SimpleSprite structure. It also shows how to reserve a sprite (sprite 2), and how to move it around. The user moves the sprite by pressing the arrow keys. In this example we animate the sprite (6 frames, taken from the arcade game Miniblast).

```
/* Extra information:
/* When we declare the window pointer, the intuition library pointer */
/* etc, we initialize them to point to NULL:
*/
* struct Window = NULL;
/* struct Window + NULL;
/* since we then know that all of the pointers will point to NULL */
/* when we start, we can check if they still point to NULL when we */
/* quit. If they do not point to NULL anymore, we close that window, */
/* library etc.
  /* Sprite data for a ship: */
/* (6 frames, 4 different images: 1 2 3 4 3 2)
UWORD chip ship_data[6][28]=

A.11 AMIGADOS

Example1

This program collects ten integer values from the user, and saves them in a file ("HighScore.dat") on the RAM disk. The memory is then cleared, and the file cursor is moved to the beginning of the file. The file is then loaded into the memory again, and printed out.

```
bytes_read = Read( file_handle, highscore, sizeof( highscore ) );

Example2

This example demonstrates how to create a directory called "MyDirectory" on the RAM disk.

```
/* Create a directory on the RAM disk: (The directory will */
/* be locked with an exclusive lock, and must therefore be */
/* unlocked before the program terminates.)
*/
lock = (struct FileLock *) CreateDir( "RAM:MyDirectory" );
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /* If there is no lock, no directory has been created. In /* that case, inform the user about the problem and leave: if ( lock == NULL )
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               printf( "ERROR Could NOT create the new directory!\n" ); exit( 0 );
                                                                                                                                                                                                                                                                                                  /* Declare a FileLock structure: */

                                                                                                                                                                                                                                                                                                                                                                                                                           void main()
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              BOOL ok;
```

Example4

This example demonstrates how to delete files and directories. It will delete the file Example 1 and directory Example 2 created. (The file and directory are supposed to have been renamed by Example 3.)

Example5

This example demonstrates how to attach a short comment to a file. A short file called "Letter.doc" will be created, and a short comment will be attached. To see the comment use the CLI command "List".

```

```

Example6

This example demonstrates how to protect and unprotect files. The file Example 5 created ("Letter.doc") will be protected, and we will then try to delete it (unsuccessfully). We will then unprotect the file and then try to delete it (successfully).

```

Example8

This program takes a directory/device name as parameter, and prints out all the file/directory-names inside it. This example describes how to use Examine() and ExNext().

```
/\ast Print out the directory/device name with underlined characters: \ast/
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   * * *

```

A.12 LOW LEVEL GRAPHICS ROUTINES

Example1

This example shows how to create your own display, and fill it with a lot of pixels in seven different colours.

```

```

Example2

This example shows how to create a large Raster and a smaller display. We fill the Raster with a lot of pixels in seven different colours and by altering the RxOffset and RyOffset values in the RasInfo structure, the Raster is scrolled in all directions. This method to scroll a large drawing in full speed is used in many games and was even used in my own racing game "Car".

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               deltaY = SPEED;
```

Example3

This example shows how to create a display that covers the entire display. This method is called "Overscan", and is primarily used in video and graphics programs, but can also be used in games etc to make the display more interesting.

                                                                                                                                              /* Set the colours: */
```

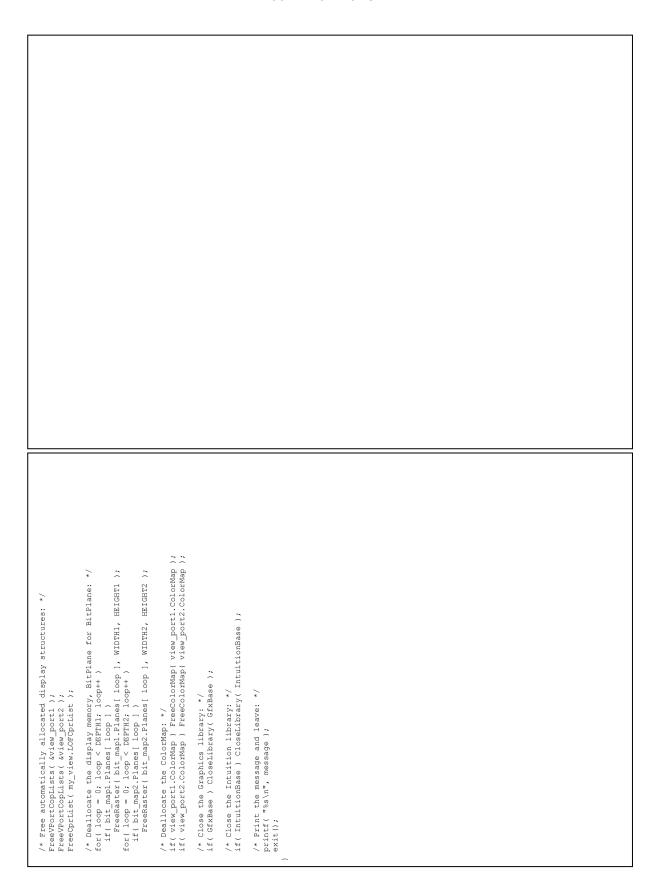

Example4

This example demonstrates how to open two different ViewPorts on the same display. The first ViewPort is in low resolution and use 32 colours, while the second ViewPort is in high resolution and only use 2 colours.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          my_bit_map.Planes[ loop ] = (PLANEPTR) AllocRaster( WIDTH, HEIGHT );
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  IMPORTANT! If you want a ViewPort to be interlaced you have to set the IACE flag in both the ViewPort as well as in the View structure. If the ViewPort is interlaced but the View is non-interlaced, only every second line in the ViewPort would be drawn. If the ViewPort is non-interlaced but the ViewPort would be drawn. ach line in the ViewPort would be drawn twice.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /* Clear the display memory with help of the Blitter: */ BltClear( my_bit_map.Planes[ loop ], RASSIZE( WIDTH, HEIGHT ), 0 );

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             int loop;
```

Example6

This example demonstrates how to create a ViewPort in dual playfield mode. Playfield 1 use four colours and is placed behind playfield 2 which only use two colours (transparent and grey). Playfield 1 is filled with a lot of dots and is scrolled around while playfield 2 is is not moved and is filled with only five grey rectangles.

A.13 VSPRITES

Example1

This example demonstrates how to get and use a VSprite. The VSprite can be moved around by the user by pressing the arrow keys.

```
/* Sizing Gadget. */
/* The window should be Active when opened.
/* FirstGadget No Custom gadgets. */
                                                                                                                                                                                                                                                              No Custom BitMap. */ when will dow to become * We will not allow the window to become * smaller than 80 x 30, and not bigger */ than 640 x 200. */
user has selected the Close window gad, or if the user has pressed a key. ^{\ast}/ Intuition should refresh the window. ^{\ast}/

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /* Close the Graphics Library: */
CloseLibrary( GfxBase );
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        int loop;
                                                                                                                                                                                                                                                                                                                                                                                                                                              main()
```

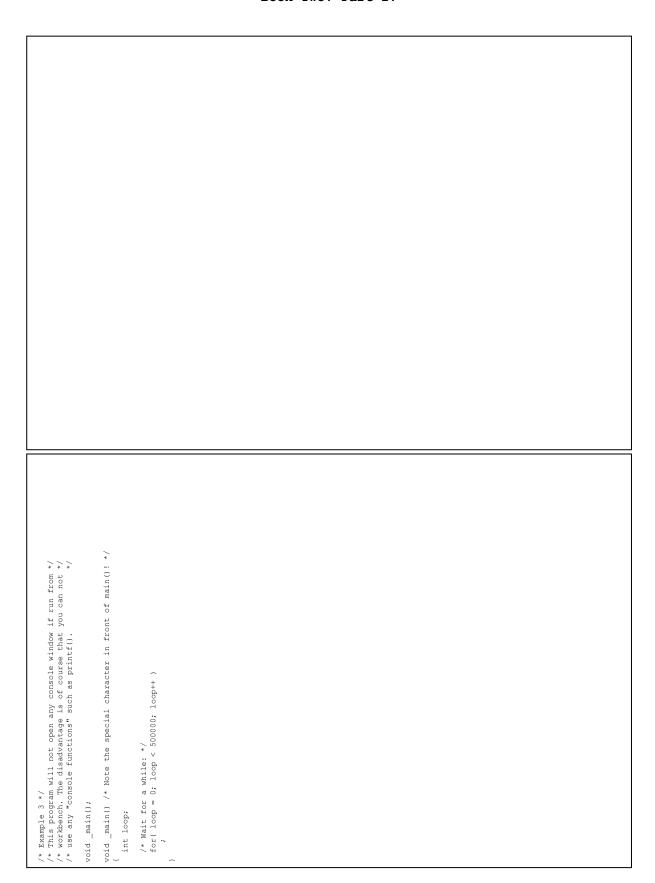

Example2

This program will print "Hello!" in the CLI window if started from CLI, or the text will be printed in a special window that is automatically opened if run from workbench.

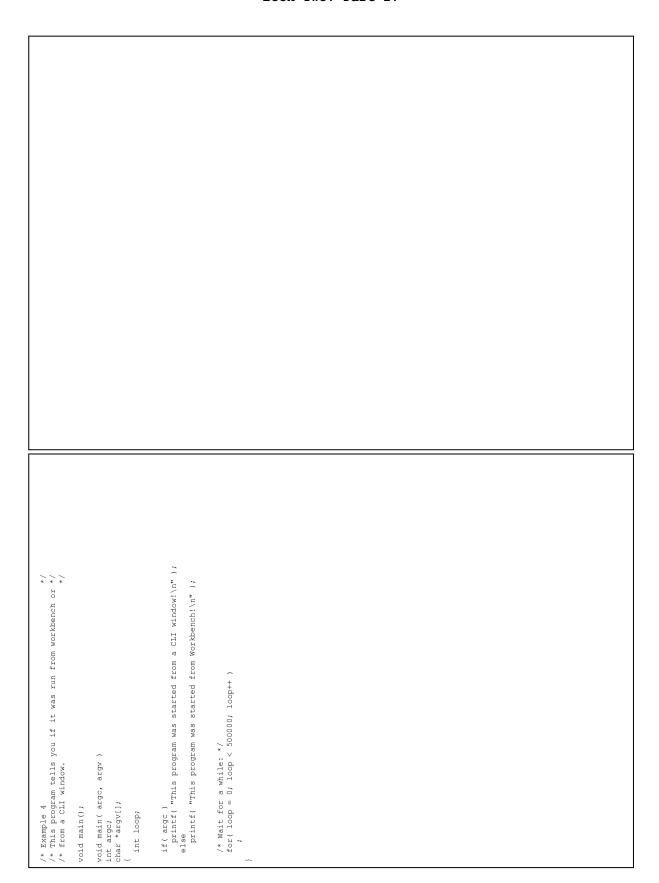

Example3

This program will not open any console window if run from workbench. The disadvantage is of course that you can not use any "console functions" such as printf().

Example4

This program tells you if it was run from workbench or from a CLI window.

B FUNCTIONS

B.1 INTRODUCTION

Here is the complete list of all functions described in the Manual .

B.2 INTUITION LIBRARY

The Intuition Library must have been opened before you may call these functions, and you will probably have to include the file "intution.h". For example:

```
#include <intuition/intuition.h>
struct IntuitionBase *IntuitionBase;
main()
  /* Open the Intuition Library: */
  IntuitionBase = (struct IntuitionBase *)
    OpenLibrary( "intuition.library", 0 );
  if( IntuitionBase == NULL )
    exit(); /* Could NOT open the Intuition Library! */
  . . . . . .
  /* Close the Intuition Library: */
  CloseLibrary( IntuitionBase );
AddGadget()
  This function adds a gadget to the gadget list.
  Synopsis: result = AddGadget( window, gadget, position );
            (long) The actual position of the gadget when it
  result:
            has been added.
  window:
            (struct Window *) Pointer to the window, to which
            the gadget should be added.
            (struct Gadget *) Pointer to the gadget which will
  gadget:
            be added.
```

position: (long) Position in the gadget list. (Starts from zero). Eg:

0 -> Before all other gadgets.

 $1 \rightarrow$ After the first gadget, but before the

second.

If a too big value is entered (or -1), the gadget

will be placed last in the list.

Important, after your program has added the necessary gadgets, you need to call the function RefreshGadgets() in order to see your changes. You may add (or take away) several gadgets, but when you are finished you must call that function.

AddVSprite()

This function will add a VSprite to the VSprite list.

Synopsis: AddVSprite(vsprite, rp);

vsprite: (struct VSprite *) Pointer to an initialized

VSprite structure.

rp: (struct RastPort *) Pointer to the RastPort.

AllocRemember()

This function allocates both memory (same as AllocMem), but will also allocate space for a Remember structure which are initialized with the size of the allocated memory, and a pointer to that memory. Each time the program allocates memory with this function, the Remember structures are linked together.

Since the Remember structures contains all necessary information about the memory, and are linked together, all memory can be deallocated with one single function call (FreeRemember()).

Synopsis: memory = AllocRemember(remember, size, type);

memory: (char *) Pointer to the new allocated memory, or NULL if no memory could be allocated. Remember!

Never use memory which you have not successfully allocated.

remember: (struct Remember **) Address of a pointer to a
 Remember structure. Before you call the
 AllocRemember() function for the first time you
 should set this pointer to NULL. (Note that it is
 a pointer to a pointer!)

size:

(long) The size (in bytes) of the memory you want. (AllocMem() always allocates memory in multiples of eight bytes. So if you only ask for 9 bytes, Exec would actually give you 16 Bytes (2*8).)

type:

(long) You need to choose one of the three following types of memory (see chapter 0 INTRODUCTION for more information about Chip and Fast memory):

MEMF CHIP

Chip memory. This memory can be accessed by both the main processor, as well as the Chips. Graphics/Sound data MUST therefore be placed in Chip memory. If it does not matter what type of memory you get (Fast or Chip), you should try to allocate Fast memory before you allocate Chip memory. (Chip memory is more valuable than Fast memory.)

MEMF FAST

Fast memory. This memory can only be accessed by the main processor. (Graphics and Sound data can NOT be stored in Fast memory, use Chip memory.) This memory is normally a little bit faster than Chip memory, since only the main processor is working with it, and it is not disturbed by the Chips.

MEMF_PUBLIC If it does not matter what type of memory you get (you do not intend to use the memory for Graphics/Sound data), you should use Fast memory. However, all Amigas do not have Fast memory, since you need to by a memory expansion in order to get it. If want to tell Exec that you would like to use Fast memory if there is any, else use Chip memory, you should ask for MEMF PUBLIC.

If you want the allocated memory to be cleared (initialized to zeros), you should set the flag ${\tt MEMF_CLEAR}$.

AutoRequest()

This function opens a Simple requester. Intuition will automatically activate it and take care of the response from the user. It will return TRUE if the left gadget was selected, and FALSE if the right gadget was selected.

Synopsis: result = AutoRequest(my_window, info_txt, pos_txt, neg txt, pos IDCMP, neg IDCMP,

width, height);

my window: (struct Window *) Pointer to a window if there

exist one, else NULL.

info txt: (struct IntuiText *) Pointer to an IntuiText

structure containing the "body text".

(struct IntuiText *) Pointer to an IntuiText pos txt: structure containing the "positive text". Eg:

"TRUE", "YES", "RETRY" etc. (Optional)

(struct IntuiText *) Pointer to an IntuiText neg txt:

structure containing the "negative text". Eg:

"FALSE", "NO", "CANCEL" etc.

pos IDCMP: (long) IDCMP flags which satisfy the "positive"

gadget. (The flag RELVERIFY is already set.)

pos IDCMP: (long) IDCMP flags which satisfy the "negative"

gadget. (The flag RELVERIFY is already set.)

width: (long) How many pixels wide the requester should

height: (long) How many lines high the requester should

(long) Boolean value. The function returns TRUE if result:

the positive gadget was satisfied, and FALSE if

the negative gadget was satisfied.

BeginRefresh()

This function will speed up your redrawing of the window. You should call this function before you start to refresh the window, and only the parts that needs to be redrawn are redrawn.

Synopsis: BeginRefresh (my window);

my window: (struct Window *) Pointer to a Window structure

which has previously been initialized by an

OpenWindow() call.

ClearDMRequest()

This function disables a Double-menu requester. The user can not open the requester any more.

Synopsis: result = ClearDMRequest(my window);

my window: (struct Window *) Pointer to the Window

structure which the requester is connected to. The DMRequest pointer in the Window structure

is set to NULL.

result: (long) If the function could disable the

DM-requester it returns TRUE, else (something went wrong, the requester is in use etc) it

returns FALSE.

ClearMenuStrip()

This function removes a menu strip from a window. Remember to always remove the menu strip before you close the window, or changes the menu strip.

Synopsis: ClearMenuStrip(my window);

my_window: (struct Window *) Pointer to the window which

menu strip should be removed.

ClearPointer()

This will remove the "custom" pointer, and replace it with Intuition's default pointer.

Synopsis: ClearPointer(my window);

my window: (struct Window *) Pointer to a Window structure

which has previously been initialized by an

OpenWindow() call.

CloseScreen()

This function will close a Custom Screen which you have previously opened.

Synopsis: CloseScreen(my_screen);

my screen: (struct Screen *) Pointer to an already opened

screen.

All windows (See chapter 2 WINDOWS for more information) on your Screen MUST have been closed before you may close the screen. If you close a window after the screen has been closed, the system will crash. (Not recommended.)

If there does not exist any more screens when you close yours, Intuition will automatically reopen the Workbench Screen.

CloseWindow()

This function will close a window you have previously opened. Remember that you need to close all windows connected to a screen before you may close the screen, and all opened windows must have been closed before your program quits.

Synopsis: CloseWindow(my window);

my window: (struct Window *) Pointer to a Window structure

which has previously been initialized by an

OpenWindow() call.

CloseWorkBench()

This function will try to close the Workbench Screen if possible. If any other programs is using the Workbench Screen, the function can not close it. Closing the Workbench will free some memory, and can therefore be used if your program needs more memory.

(Remember to reopen the Workbench Screen when your program terminates.)

Synopsis: result = CloseWorkBench();

result: (long) A boolean value which tell us if the

Workbench screen has been (or already was)

closed (TRUE), or not (FALSE).

CurrentTime()

This function gives the current time.

Synopsis: CurrentTime(seconds, micros);

seconds: (long *) Pointer to an ULONG variable which will be

initialized with the current seconds stamp.

micros: (long *) Pointer to an ULONG variable which will be

initialized with the current micros stamp.

DisplayAlert()

This function activates an Alert message.

Synopsis: result = DisplayAlert(nr, message, height);

nr: (long) Value which describes if it is a

RECOVERY ALERT or a DEADEND ALERT.

message: (char *) Pointer to an array of characters (char). It contains the strings we want to display, and some extra information (position etc). The string itself is divided into substrings, which all contain information about its position etc.

- 2 bytes (16-bit) which are used for the x position of the text.
- 1 byte (8-bit) which is used for the y position of the text.
- The text string which ends with a NULL (' $\0$ ') sign.
- A Continuation byte. If it is TRUE there is another substring after this one, else this was the last substring.

height: (long) The height of the Alert box.

result: (long) The function DisplayAlert() returns a boolean value. If it is a RECOVERY_ALERT and the user pressed the left mouse button it returns TRUE else, if the user pressed the right mouse button, it returns FALSE. If it is a DEADEND_ALERT the function will immediate return FALSE.

DisplayBeep()

This function flashes the screen's colours. Can be used whenever you want to catch the user's attention.

Synopsis: DisplayBeep(screen);

screen: (struct Screen *) Pointer to the screen, which colours you want to flash. If you have not opened a screen yourself (you are using the Workbench Screen), you can find a pointer to that screen in the Window structure: (my_window is a pointer to an opened window)

DisplayBeep(my window->WScreen);

DoubleClick()

This function checks if the user double-clicked on one of the mouse buttons. You give the function the current as well as the previous time when the button was pressed, and it will check the preferences and return TRUE if the two button events happened within the time limit.

Synopsis: double = DoubleClick(sec1, mic1, sec2, mic2);

double: (long) If the two button events happened within the current time limit, the function will return TRUE, else it will return FALSE.

(long) Time (seconds) when the button was pressed sec1: for the first time. mic1: (long) Time (micros) when the button was pressed for the first time. sec2: (long) Current time (seconds). (long) Current Time (micros). mic2: DrawBorder() This function draws the specified Borders into a RastPort (Screen/Window). Synopsis: DrawBorder(rast port, border, x, y); rast port: (struct RastPort *) Pointer to a RastPort. If the lines should be drawn in a window, and my window is a pointer to that window, you write: my window->RPort. If the lines should be drawn in a Screen, and my screen is a pointer to that screen, you write: my screen->RastPort. (struct Border *) Pointer to a Border structure border: which has been initialized with your requirements. (long) Number of pixels added to the x coordinates. х: (long) Number of lines added to the y coordinates. у: DrawGList() This function will draw the VSprites into the specified Rastport. Synopsis: DrawGList(rp, vp); (struct RastPort *) Pointer to the RastPort. rp: (struct ViewPort *) Pointer to the ViewPort. vp: DrawImage()

-319-

This function draws the specified images into a RastPort

(Screen/Window).

Synopsis: DrawImage(rast port, image, x, y);

rast port: (struct RastPort *) Pointer to a RastPort.

If the images should be drawn in a window, and my_window is a pointer to that window, you write:

my window->RPort.

If the images should be drawn in a Screen, and my screen is a pointer to that screen, you write:

my screen->RastPort.

image: (struct Image *) Pointer to an Image structure

which has been initialized with your requirements.

x: (long) Number of pixels added to the x position of

the image.

y: (long) Number of lines added to the y position of

the image.

EndRefresh()

This function will tell Intuition that you have finished with your redrawings. IMPORTANT! If you receive a REFRESHWINDOW message, you must call the functions BeginRefresh() and EndRefresh(), even if you do not want to redraw anything.

Synopsis: EndRefresh(my_window);

my window: (struct Window *) Pointer to a Window structure

which has previously been initialized by an

OpenWindow() call.

EndRequest()

This function deactivates a requester which has been activated.

Synopsis: EndRequest(my requester, my window);

my requester: (struct Requester *) Pointer to the Requester

structure which will be removed.

my window: (struct Window *) Pointer to the Window

structure which the requester is connected to.

FreeRemember()

This function deallocates all memory which has been allocated by the AllocRemember() function. Note, you can deallocate all

Remember structures only, and deallocate the memory yourself, if you want to.

Synopsis: FreeRemember(remember, everything);

remember: (struct Remember **) Address of a pointer to the

first Remember structure (initialized by the AllocRemember() function). (Note that it is a

pointer to a pointer!)

everything: (long) A boolean value. If everything is equal

to TRUE, all memory (both the allocated memory and the Remember structures) are deallocated. However, if everything is equal to FALSE, only the Remember structures are deallocated, and you

have to deallocate the memory yourself.

GetDefPrefs()

This function makes a copy of the default Preferences structure.

Synopsis: pref = GetPrefs(buffer, size);

pref: (struct Preferences *) Pointer to the default

preferences. If the function could not make a copy

of the preferences, the function returns NULL.

buffer: (struct Preferences *) Pointer to the memory buffer

which should be used to store a copy of the default

preferences in.

size: (long) The number of bytes you want to copy to the

buffer. Important, the buffer must be at least as

big as the number of bytes you want to copy.

GetMsg()

This function tries to get a message from a message port.

Synopsis: my message = GetMsg(my message port);

my_message: (struct Message *) Pointer to a Message

structure, in this case a pointer to an IntuiMessage structure, or NULL if no

message was collected.

my_message_port: (struct MsgPort *) Pointer to an MsgPort. If

you have opened a window, you can find your

window's message port in the Window structure. (my_window->UserPort)

GetPrefs()

This function makes a copy of the Preferences structure.

Synopsis: pref = GetPrefs(buffer, size);

pref: (struct Preferences *) Pointer to your preferences.

Same as your memory pointer (buffer), but is

returned so you can check if you got a copy or not. If you could not get a copy of the preferences, the

function returns NULL.

buffer: (struct Preferences *) Pointer to the memory buffer

which should be used to store a copy of the

preferences in.

size: (long) The number of bytes you want to copy to the

buffer. Important, the buffer must be at least as

big as the number of bytes you want to copy.

InitGels()

This function "gives" an already prepared GelsInfo structure to the system.

Synopsis: InitGels(head, tail, ginfo);

head: (struct VSprite *) Pointer to the first "dummy"

VSprite structure.

tail: (struct VSprite *) Pointer to the second "dummy"

VSprite structure.

ginfo: (struct GelsInfo *) Pointer to an initialized GelsInfo

structure.

ItemAddress()

This function returns a pointer to the Menu or Item structure which is specified by the menu number.

Synopsis: ItemAddress(my_menu, menu_number);

my_menu: (struct Menu *) Pointer to the first Menu

structure in the menu strip.

menu number: (USHORT) This menu number specifies a subitem/

item/menu.

Lock()

This function "locks" a file so no other processes may alter the contents (SHARED_LOCK). You can even prevent other processes to read the file (EXCLUSIVE LOCK).

Synopsis: lock = Lock(name, mode);

lock: (BPTR) Actually a pointer to a FileLock structure.

name: (char *) Pointer to a text string which contains

the file/directory name.

mode: (long) Accessmode:

SHARED LOCK: Other tasks may read the file.

ACCESS READ: - " -

EXCLUSIVE LOCK: No other tasks may use this f.

ACCESS WRITE: - " -

ModifyIDCMP()

This function changes the Window structure's IDCMPFlags field.

Synopsis: ModifyIDCMP(my_window, IDCMPFlags);

my window: (struct Window *) Pointer to an already opened

window.

IDCMPFlags: (long) None or more IDCMP flags.

If you call this function with no IDCMP flags set, the window's IDCMP Ports will be closed. On the other hand, if you call this function, with one or more IDCMP flags set, a Port will be, if necessary, opened for you.

ModifyProp()

This function modifies a proportional gadget's values and knob. For example, if your program is reading files from the disk, VertBody was maybe equal to 0xFFFF (MAXBODY) in the beginning, but as more files are collected from the disk, you maybe want to change the size of the knob etc. You then simply call this function and it will change the values as well as redraw the gadget.

Synopsis: ModifyProp(gadget, window, requester, flags,

horiz pot, vert pot, horiz body, vert body);

gadget: (struct Gadget *) Pointer to the proportional

gadget which should be changed and redrawn.

window: (struct Window *) Pointer to the window which

the proportional gadget is connected to.

requester: (struct Requester *) If the gadget is connected

to a requester, set this pointer to point to that requester, else NULL. Important, if this gadget is connected to a requester, it must be

displayed when you execute this command!

flags: (long) Here is the list of all flags you may

use:

FREEHORIZ Set this bit if you want the

user to be able to move the $% \left(1\right) =\left(1\right) \left(1\right)$

knob horizontally.

FREEVERT Set this bit if you want the

user to be able to move the

knob vertically.

AUTOKNOB Set this bit if you want that

the size of the knob to be controlled by Intuition.
(HorizBody and VertBody affects the size of the

Autoknob.)

- If you want to use
Intuition's Autoknob you
should give GadgetRender a
pointer to an Image structure.
(You do not need to initialize
the Image structure since
Intuition takes care of it.)

- If you on the other hand would like to use your own knob image, you give GadgetRender a pointer to your

Image structure, which you have

initialized yourself.

PROPBORDERLESS Set this bit if you do not

want any border around the \cdot

container.

(See chapter 4.7 for more information.)

horiz pot: (long) This variable contains the actual

(horizontally) proportional value. If the knob should be moved 25% to the right, HorizPot should be set to 25% of MAXPOT (0xFFFF).

(0xFFFF * 0.25 = 0x3FFF)

vert_pot: (long) Same as HorizPot except that this is the

vertically proportional value.

horiz_body: (long) Describes how much HorizPot should change

every time the user clicks inside the container. If the volume of a melody can be between 0-63

(64 steps), HorizPot should change 1/64 each time. The HorizBody should therefore be set to: 1/64 * MAXBODY (0xFFFF) == 3FF

HorizBody describes also how much the user can see/use of the entire data. For example, if you have a list of 32 file names, and the user only can see 8 names at one time (25%), the knob (AUTOKNOB) should fill 25% of the container. HorizBody should in this case be set to: MAXBODY * 8 / 32 (25%) of 0xFFFF == 3FFFF

(AUTOKNOB).

MoveScreen()

This function will move the screen. For the moment you may only move it vertically.

Synopsis: MoveScreen(my_screen, delta_x, delta_y);

my screen: (struct Screen *) Pointer to the screen which

you want to move.

delta x: (long) Number of pixels which the screen

should move horizontally. For the moment you may not move a screen horizontally, set it

therefore to 0.

delta y: (long) Number of lines which the screen should

move vertically.

MoveWindow()

This function will move a window. It has the same effect as if the user would have moved the window by using the Drag Gadget.

Synopsis: MoveWindow(my window, delta x, delta y);

my window: (struct Window *) Pointer to a Window structure

which has previously been initialized by an

OpenWindow() call.

delta_x: (long) Deltamovement horizontally.

delta y: (long) Deltamovement vertically.

MrgCop()

This function reorganizes the Copper list. This is why each VSprite can have its own individual colour values.

Synopsis: MrgCop(view);

view: (struct View *) Pointer to the View structure which

copper list should be changed.

OffGadget()

This function disables a gadget (sets the GADGDISABLED bit in the gadget structure's Flags field):

Synopsis: OffGadget(gadget, window, requester);

gadget: (struct Gadget *) Pointer to the gadget which will

be disabled.

window: (struct Window *) Pointer to the window that the

gadget is attached to.

requester: (struct Requester *) If the gadget is connected to

a requester, set this pointer to point to that requester, else NULL. Important, if this gadget is connected to a requester, it must be displayed

when you execute this command!

OnGadget()

This function enables a gadget (removes the GADGDISABLED bit in the gadget structure's Flags field):

Synopsis: OnGadget (gadget, window, requester);

gadget: (struct Gadget *) Pointer to the gadget which

will be enabled.

window: (struct Window *) Pointer to the window that the

gadget is attached to.

requester: (struct Requester *) If the gadget is connected

to a requester, set this pointer to point to that requester, else NULL. Important, if this gadget is connected to a requester, it must be displayed

when you execute this command!

Remember, as long as the gadget is disabled the user can not select it, and it will not broadcast any messages. A disabled gadget is drawn as usual except that it "ghosted".

OffMenu()

This function can disable a subitem, an item or even a whole menu. The image or text of the disabled items etc will be "ghosted", and the user can not select them.

Synopsis: OffMenu(my_window, menu_number);

my window: (struct Window *) Pointer to the window which

the menu strip is connected to.

menu_number: (USHORT) This menu number specifies what should

be disabled. Use the macros ${\tt SHIFTMENU}$, ${\tt SHIFTITEM}$

and SHIFTSUB to calculate the correct menu number. If you just specify a menu, all items to that menu will be disabled. If you specify a menu and an item, that item will be disabled, and so all subitems connected to it if there are

any.

OnMenu()

This function can enable a subitem, an item or even a whole menu. The image or text of the enabled items etc, will become normal (not "ghosted") and the user can now select them.

Synopsis: OnMenu(my window, menu number);

my window: (struct Window *) Pointer to the window which

the menu strip is connected to.

menu_number: (USHORT) This menu number specifies what should

be enabled. Use the macros SHIFTMENU, SHIFTITEM

and SHIFTSUB to calculate the correct menu

number. If you just specify a menu, all items to that menu will be enabled. If you specify a menu and an item, that item will be enabled, so all

subitem connected to it if there are any.

OpenScreen()

This function will open a Custom Screen with your requirements.

Synopsis: my screen = OpenScreen(my new screen);

my screen: (struct Screen *) Pointer to a Screen

structure. It will point to your newly opened screen or be equal to NULL if the screen could

not be opened.

my new screen: (struct NewScreen *) Pointer to a NewScreen

structure which contains your preferences.

OpenWindow()

This function will open a window with the characteristics defined in the NewWindow structure. It returns a pointer to a Window structure.

If you are going to use the Workbench screen, and it has been closed, it will automatically reopen. If you on the other hand is going to connect the window to a Custom screen, you need to open it yourself before calling the OpenWindow() function.

Synopsis: my window = OpenWindow (my new window);

my_window: (struct Window *) Pointer to a Window structure

or NULL if the window could not be opened.

my new window: (struct NewWindow *) Pointer to a NewWindow

structure which has been initialized with

your requirements.

OpenWorkBench()

This function will try to open the Workbench Screen if there exist enough memory.

Synopsis: result = OpenWorkBench();

result: (long) A boolean value which tell us if the

Workbench Screen has been (or already was)

opened (TRUE), or not (FALSE).

PrintIText()

This function prints text into a RastPort (Screen/Window).

Synopsis: PrintIText(rast port, intui text, x, y);

rast port: (struct RastPort *) Pointer to a RastPort.

If the text should be printed in a window, and my_window is a pointer to that window, you write:

my window->RPort.

If the text should be printed in a Screen, and my_screen is a pointer to that screen, you write:

my screen->RastPort.

intui text: (struct IntuiText *) Pointer to a IntuiText

structure which has been initialized with your requirements.

 \mathbf{x} : (long) Number of pixels added to the \mathbf{x} position

of the characters.

y: (long) Number of lines added to the y position

of the characters.

RefreshGadgets()

This function redraws all the gadgets in the list, starting by the specified gadget. If you for example has added or deleted a gadget you need to call this function to see the changes. On the other hand, if you have changed the imagery of a gadget, or the gadget's image has been trashed by something, you can also use this function to refresh the display.

Synopsis: RefreshGadgets (gadget, window, requester);

gadget: (struct Gadget *) Pointer to the gadget where the

redrawing should start. This gadget, and all the following gadgets in the list will be redrawn.

window: (struct Window *) Pointer to the window which the

gadgets are connected to.

requester: (struct Requester *) If the gadget is connected to

a requester, set this pointer to point to that requester, else NULL. Important, if this gadget is connected to a requester, it must be displayed when you execute this command! (See chapter 5 REQUESTERS for more information about requesters.)

RemoveGadget()

This function removes a gadget from the list:

Synopsis: result = RemoveGadget(window, gadget);

result: (long) The position of the removed gadget or -1 if

something went wrong.

window: (struct Window *) Pointer to the window that the

gadget is connected to.

gadget: (struct Gadget *) Pointer to the gadget which will

be removed.

Important, after your program has removed the necessary gadgets, you need to call the function RefreshGadgets() in

order to see your changes. You may take away (or add) several gadgets, but when you are finished you must call that function.

ReplyMsg()

This function tells Intuition that you have finished reading the message. Remember, once you have replied you may not examine or change the IntuiMessage structure any more.

Synopsis: ReplyMsg(my message);

my message: (struct Message *) Pointer to a Message

structure, in this case a pointer to an

IntuiMessage structure.

ReportMouse()

You can call this function if you want the window to start/ stop reporting the mouse position. (See chapter 8 IDCMP for more information about REPORTMOUSE.)

Synopsis: ReportMouse(my window, boolean);

my window: (struct Window *) Pointer to a Window structure

which has previously been initialized by an

OpenWindow() call.

boolean: (long) Set to TRUE if you want the window to start

reporting mouse position, else set to FALSE, and

the window will stop reporting.

Request()

This function activates a requester connected to a window.

Synopsis: result = Request(my_requester, my_window);

my requester: (struct Requester *) Pointer to the Requester

structure.

my window: (struct Window *) Pointer to the Window

structure which the requester should be

connected to.

result: (long) Boolean value returned. If Intuition

could successfully open the requester the function returns TRUE, else (something went wrong, not enough memory etc) the function

returns FALSE.

ScreenToBack()

This will move the screen behind all other screens.

Synopsis: ScreenToBack(my screen);

my screen: (struct Screen *) Pointer to the screen which

you want to move.

ScreenToFront()

This will move the screen in front of all other screens.

Synopsis: ScreenToFront(my screen);

my screen: (struct Screen *) Pointer to the screen which

you want to move.

SetDMRequest()

This function allows the user to activate a Double-menu requester by clicking twice on the mouse menu button.

Synopsis: result = SetDMRequest(window, requester);

window: (struct Window *) Pointer to the Window structure

which the requester should be connected to.

requester: (struct Requester *) Pointer to the Requester

structure.

result: (long) Boolean value returned. If Intuition could

successfully open the requester the function returns TRUE, else (something went wrong, not enough memory or a DM requester is already

connected to the window, etc) the function returns

FALSE.

SetMenuStrip()

This function connects a menu strip to a window. Remember that the window must have been opened before you may connect a menu strip to that window.

Synopsis: SetMenuStrip(my_window, my_menu);

my window: (struct Window *) Pointer to the window which the

menu strip should be connected to.

(struct Menu *) Pointer to the first Menu my menu:

structure in the menu strip.

SetPointer()

This function allows you to change the window's pointer.

Synopsis: SetPointer(my window, data, height, width, x, y);

my window: (struct Window *) Pointer to a Window structure

which has previously been initialized by an

OpenWindow() call.

data: (short *) Pointer to the Sprite data.

width: (long) The width of the pointer. Less or equal

to 16.

height: (long) The height of the pointer. Can be any

height.

(long) The pointer's "Hot Spot" x position. х:

(long) The pointer's "Hot Spot" y position. у:

SetPrefs()

This function saves a modified preferences structure. Do NOT change the preferences unless the user really WANTS to!

Synopsis: SetPrefs(pref, size, doit);

(struct Preferences *) Pointer to your modified pref:

Preferences structure.

size: (long) The number of bytes you want to change.

doit: (long) Boolean value which if FALSE, changes the

preferences, but will not send a NEWPREFS message. If doit is equal to TRUE, the settings will be changed, and a NEWPREFS message will be sent. As long as the user is changing the values, doit should be FALSE, but when the user has finished,

set it to TRUE, and all programs will get a NEWPREFS

message.

SetWindowTitles()

This function allows you to change the window title after the window has been opened.

Synopsis: SetWindowTitles(my window, window t, screen t);

my window: (struct Window *) Pointer to a Window structure

which has previously been initialized by an

OpenWindow() call.

window_t: (char *) Pointer to a NULL-terminated string which

will become the window's title, or

0 : clear title bar, or
-1 : keep the old title.

screen t: (char *) Pointer to a NULL-terminated string which

will become the window's screen title, or

0 : clear title bar, or
-1 : keep the old title.

ShowTitle()

This function will make the screen's Title appear above or behind any Backdrop Windows (See chapter 2 WINDOWS for more information about Backdrop Windows). (The screen's title appear always behind normal windows.)

Synopsis: ShowTitle(my screen, show it);

my screen: (struct Screen *) Pointer to the screen.

show it: (long) A boolean value which can be:

TRUE: The title will be in front of any Backdrop Windows, but behind any

other windows.

FALSE: The Title will be behind any windows

SizeWindow()

This function will change the size of the window as desired. It has the same effect as if the user would have resized the window by using the Size Gadget.

Synopsis: SizeWindow(my window, delta x, delta y);

my window: (struct Window *) Pointer to a Window structure

which has previously been initialized by an

OpenWindow() call.

delta x: (long) Number of pixels the horizontally size of

the window will change.

delta y: (long) Number of pixels the vertically size of the

window will change.

SortGList()

This function will reorganize the VSprite list so that the further down on the display the sprites are positioned the later they will appear in the list.

Synopsis: SortGList(rp);

rp: (struct RastPort *) Pointer to the RastPort.

WBenchToBack()

This will move the Workbench Screen behind all other screens.

Synopsis: result = WBenchToBack();

result: (long) A boolean value which is TRUE if the

Workbench screen was open, or FALSE it it was

not.

WBenchToFront()

This will move the Workbench Screen in front of all other screens.

Synopsis: result = WBenchToFront();

result: (long) A boolean value which is TRUE if the

Workbench screen was open, or FALSE it it was

not.

WindowLimits()

This function will change the maximum/minimum size limits of the window. Any values which are set to 0 will remain unchanged.

Synopsis: WindowLimits (my window, min w, min h, max w, max h);

my window: (struct Window *) Pointer to a Window structure

which has previously been initialized by an

OpenWindow() call.

min_w: (long) Minimum width of the window.

min h: (long) Minimum height of the window.

max w: (long) Maximum width of the window.

max h: (long) Maximum height of the window.

```
WindowToFront()
  This function will put the window in front of all other
  windows.
  Synopsis: WindowToFront( my window );
  my window: (struct Window *) Pointer to a Window structure
             which has previously been initialized by an
             OpenWindow() call.
WindowToBack()
  This function will push the window behind all other windows.
  Synopsis: WindowToBack( my window );
  my window: (struct Window *) Pointer to a Window structure
             which has previously been initialized by an
             OpenWindow() call.
B.3 GRAPHICS LIBRARY
The Graphics Library must have been opened before you may call
these functions. For example:
struct GfxBase *GfxBase;
main()
  /* Open the Graphics Library: */
  GfxBase = (struct GfxBase *)
   OpenLibrary( "graphics.library", 0 );
  if( GfxBase == NULL )
    exit(); /* Could NOT open the Graphics Library! */
  . . . . . .
  /* Close the Graphics Library: */
  CloseLibrary( GfxBase );
AllocRaster()
```

This function reserves display memory (one BitPlane).

```
Synopsis: pointer = AllocRaster( width, height );
            (PLANEPTR) Pointer to the allocated memory or NULL
            if enough memory could not be reserved.
            (long) The width of the BitMap.
  width:
  height: (long) The height of the BitMap.
AreaDraw()
  This function will add a new vertex to the vector list.
  Synopsis: AreaDraw( rast port, x, y );
  rast port: (struct RastPort *) Pointer to the RastPort that
             should be affected.
  х:
             (long) New X position.
            (long) New Y position.
  у:
AreaEnd()
  This function will close, draw and fill the polygon.
  Synopsis: AreaEnd( rast port );
  rast port: (struct RastPort *) Pointer to the RastPort that
             should be affected.
AreaMove()
  This function will start a new polygon.
  Synopsis: AreaMove( rast port, x, y );
  rast port: (struct RastPort *) Pointer to the RastPort that
             should be affected.
             (long) Start X position.
  х:
            (long) Start Y position.
  у:
BltBitMap()
  This function copies parts of BitMaps directly without
  worrying about overlapping layers.
```

Synopsis: BltBitMap(sb, sx, sy, db, dx, dy, w, h, fl, m, t);

(struct BitMap *) Pointer to the "source" BitMap. sb: (long) X offset, source. sx: (long) Y offset, source. sy: (struct BitMap *) Pointer to the "destination" db: BitMap. (long) X offset, destination. dx: (long) Y offset, destination. dy: w: (long) The width of the memory area that should be copied. h: (long) The height of the memory area that should be copied. fl: (long) The four leftmost bits tells the blitter what kind of logically operations should be done. (long) You can here define a BitMap mask, and tell m: the blitter which BitPlanes should be used, and which should not. The first bit represents the first BitPlane, the second bit the second BitPlane and so on. If the bit is on (1) the corresponding BitPlane will be used, else (0) the BitPlane will not be used. To turn off BitPlane zero and two, set the mask value to 0xFA (11111010). To use all BitPlanes set the mask value to 0xFF (11111111). (char *) If the copy overlaps and this pointer t: points to some chip-memory, the memory will be used to store the temporary area in. However, normally you do not need to bother about this value. BltClear() This function clears large rectangular memory areas. This function work together with the blitter and is therefore very fast. Synopsis: BltClear(pointer, bytes, flags); (char *) Pointer to the memory. pointer (long) The lower 16 bits tells the blitter how many bytes: bytes per row, and the upper 16 bits how many rows.

This value is automatically calculated for you with help of the macro RASSIZE(). Just give RASSIZE() the correct width and height and it will return the

correct value. [RASSIZE() is defined in file
"gfx.h".]

flags: (long) Set bit 0 to force the function to wait until the Blitter has finished with your request.

BNDROFF()

This macro (declared in file "gfxmacro.h") will turn off the outline mode.

Synopsis: BNDROFF(rast_port);

rast_port: Pointer to the RastPort which outlinefunction

should be turned off.

ClipBlit()

This function copies parts of BitMaps with help of Rastports and will therefore care about overlapping layers, and should be used if you have windows on your display.

Synopsis: ClipBlit(srp, sx, sy, drp, dx, dy, w, h, flag);

srp: (struct RastPort *) Pointer to the "source"

RastPort.

sx: (long) X offset, source.

sy: (long) Y offset, source.

drp: (struct RastPort *) Pointer to the "destination"

RastPort.

dx: (long) X offset, destination.

dy: (long) Y offset, destination.

w: (long) The width of the memory area that should be

copied.

h: (long) The height of the memory area that should be

copied.

flag: (long) This value tells the blitter what kind of

logically operations should be done. See below for

more information.

Draw()

This function draws single lines from the current position

to the new specified position. Synopsis: Draw(rast port, x, y); rast port: (struct RastPort *) Pointer to the RastPort that should be affected. (long) The new X position. х: (long) The new Y position. у: Flood() This function will flood fill complicated objects. Synopsis: Flood(rast port, mode, x, y); rast port: (struct RastPort *) Pointer to the RastPort that should be affected. mode: (long) Which mode should be used. If you want to use the Colour mode set the mode variable to 1, to get the Outline mode set the mode variable to 0. (long) X position where the flood fill should х: start. (long) Y position where the flood fill should у: start. FreeColorMap() This function deallocates the memory that was allocated by the GetColorMap() function. Remember to deallocate all memory that you allocate. For every GetColorMap() function there should be one FreeColorMap() function. FreeColorMap(colormap); colormap: (struct ColorMap *) Pointer to a ColorMap structure that GetColorMap() returned and you now want to deallocate. FreeCprList() This function will return all memory that was automatically allocated by the MrgCop() function. Synopsis: FreeCprList(cprlist); cprlist: (struct cprlist *) Pointer to the View's cprlist

(LOFCprList) structure. If the View was interlaced you must also call the FreeCprList function with a pointer to the SHFCprList.

```
FreeRaster()
 This function will deallocate display memory (BitPlane).
 Remember to deallocate all BitPlanes!
 Synopsis: FreeRaster(bitplane, width, height);
 bitplane: (PLANEPTR) Pointer to a Bitplane.
 width:
          (long) The Bitplane's width.
 height: (long) The Bitplane's height.
FreeVPortCopLists()
 This function will return all memory that was automatically
 allocated by the MakeVPort() function. Remember to call
 FreeVPortCopLists() for every ViewPort you have created!
 Synopsis: FreeVPortCopLists( viewport );
 view:
            (struct ViewPort *) Pointer to the ViewPort.
GetColorMap()
 This function allocates and initializes a ColorMap structure.
 Synopsis: colormap = GetColorMap( colours );
 colormap: (struct ColorMap *) GetColorMap returns a pointer
            to the ColorMap structure it has allocated and
            initialized, or NULL if not enough memory.
 colours: (long) A value specifying how many colours you
            want that the ColorMap structure should store.
            (1, 2, 4, 8, 16, 32)
InitBitMap()
 This function initializes a BitMap structure.
 Synopsis: InitBitMap( bitmap, depth, width, height );
 bitmap: (struct BitMap *) Pointer to the BitMap.
```

```
(long) How many BitPlanes used.
  depth:
  width: (long) The width of the raster.
  height: (long) The height of the raster.
InitRastPort()
  This function initializes a RastPort.
  Synopsis: InitRastPort( rast port );
  rast_port: (RastPort *) Pointer to the RastPort that should
             be Initialized.
InitView()
  This function will initialize a View structure.
  Synopsis: InitView( view );
  view:
            (struct View *) Pointer to the View that should be
            initialized.
InitVPort()
  This function will initialize a ViewPort structure.
  Synopsis: InitVPort( view port );
  view port: (struct ViewPort *) Pointer to the ViewPort that
             should be initialized.
MakeVPort()
  This function prepares the Amiga's hardware (especially the
  Copper) to display a ViewPort. NOTE! You have to prepare
  EVERY ViewPort you are going to use!
  Synopsis: MakeVPort( view, viewport );
  view:
            (struct View *) Pointer to the ViewPort's View.
  viewport: (struct ViewPort *) Pointer to the ViewPort.
```

Move()

```
This function moves the cursor.
  Synopsis: Move( rast port, x, y );
  rast port: (struct RastPort *) Pointer to the RastPort that
             should be affected.
             (long) The new X position.
  х:
             (long) The new Y position.
  у:
MrgCop()
  This function puts together all displayinstructions and
  prepares the view to be showed.
  Synopsis: MrgCop( view );
  view:
            (struct View *) Pointer to the View.
LoadView()
  This function will start showing a View. Remember that when
  you close your View you must switch back to the old view.
  (See examples for more details.)
  Synopsis: LoadView( view );
  view:
          (struct View *) Pointer to the View.
PolyDraw()
  This function will draw multiple lines.
  Synopsis:
             PolyDraw( rast port, number, coordinates );
               (struct RastPort *) Pointer to the RastPort that
  rast port:
               should be affected.
  number:
               (long) The number of coordinates (x,y) defined
               in the array.
  coordinates: (short *) Pointer to an array of coordinates.
ReadPixel()
  This function reads the colour value of a pixel.
  Synopsis: colour = ReadPixel( rast port, x, y );
```

colour: (long) ReadPixel returns the colour value of the

specified pixel (colour 0 - 255) or -1 if the

coordinates were outside the Raster.

rast port: (struct RastPort *) Pointer to the RastPort which

contain the pixel you want to examine.

x: (long) X position of the pixel.

y: (long) Y position of the pixel.

RectFill()

This function will draw filled rectangles.

Synopsis: RectFill(rast_port, minx, miny, maxx, maxy);

rast port: (struct RastPort *) Pointer to the RastPort that

should be affected.

minx: (long) Left position of the rectangle.

miny: (long) Top - " -

maxx: (long) Right - " -

maxy: (long) Bottom - " -

SetAfPt()

This function will set the area pattern:

Synopsis: SetAfPt(rast port, area pattern, pow2);

rast_port: (struct RastPort *) Pointer to the RastPort

that should be affected.

area pattern: (UWORD) Pointer to an array of UWORDS that

generate the pattern. Each bit in the array

represents one dot.

pow2: (BYTE) The pattern must be two to the power of

pow2 lines tall. If the pattern is one line tall pow2 should be set to 0, if the pattern is two

lines tall pow2 should be set to 1, if the

pattern is four lines tall pow2 should be set to 2, and so on. (If you use multicoloured patterns the pow2 should be negative. A sixteen lines tall multicoloured pattern should therefore have

the pow2 value set to -4 [2⁴ = 16].)

SetAPen() This function will change the FgPen's colour. SetAPen(rast port, new colour); Synopsis: rast port: (struct RastPort *) Pointer to the RastPort that should be affected. new colour: (long) A new colour value. SetBPen() This function will change the BgPen's colour. SetBPen(rast port, new colour); Synopsis: rast port: (struct RastPort *) Pointer to the RastPort that should be affected. new colour: (long) A new colour value. SetDrMd() This function will change the drawing mode. Synopsis: SetDrMd(rast port, new mode); rast port: (struct RastPort *) Pointer to the RastPort that should be affected. (long) The new drawing mode. Set one of the new mode: following: JAM1, JAM2, COMPLEMENT, INVERSVID|JAM1 or INVERSVID|JAM2. JAM1 The FgPen will be used, the background unchanged. (One colour jammed into a Raster.) JAM2 The FgPen will be used as foreground pen while the background (when you are writing text for example) will be filled with the BgPen's colour. (Two colours are jammed into a Raster.) Each pixel affected will be drawn COMPLEMENT with the binary complement colour. Where you write 1's the

will be reversed.

corresponding bit in the Raster

INVERSVID|JAM1 This mode is only use together with text. Only the background of the text will be drawn with the FgPen.

INVERSVID|JAM2 This mode is only use together with text. The background of the text will be drawn with the FgPen, and the characters itself with the BgPen.

SetDrPt()

This function will set the line pattern.

Synopsis: SetDrPt(rast port, line pattern);

rast port: (struct RastPort *) Pointer to the RastPort

that should be affected.

line pattern: (UWORD) The pattern. Each bit represents one

dot. To generate solid lines you set the

[bin]).

SetOPen()

This macro will change the AOlPen's colour. Note! This is not a function. It is actually a macro that is defined in the header file "gfxmacros.h". If you want to use this function you have to remember to include this file.

Synopsis: SetOPen(rast_port, new_colour);

rast_port: (struct RastPort *) Pointer to the RastPort that

should be affected.

new colour: (long) A new colour value.

SetRast()

This function sets a whole Raster to a specific colour.

Synopsis: SetRast(rast port, colour);

rast port: (struct RastPort *) Pointer to the RastPort that

should be affected.

colour: (long) The colour reg. you want to fill the whole

raster with.

SetRGB4()

This function allows you to change your screen's colours. Each colour may be picked out of a 4096 colour palette. (16 levels of red, 16 levels of green and 16 levels of blue; 16*16*16 = 4096.)

IMPORTANT! Before you may use this function you must have opened the Graphics Library. (All other functions are in the Intuition Library.) (See chapter 0 AMIGA for more information.)

Synopsis: SetRGB4(viewport, register, red, green, blue);

viewport: (struct ViewPort *) Pointer to a ViewPort which colour registers we are going to change. We can

find the screen's ViewPort in the Screen

structure. (If my_screen is a pointer to a Screen

structure, this will get us a pointer to that

screen's ViewPort: &my screen->ViewPort)

register: (long) The colour register you want to change.

The screen's Depth decides how many colour

registers the screen have:

| Depth | Colour Registers |
|-------|------------------|
| | |
| 1 | 0 - 1 |
| 2 | 0 - 3 |
| 3 | 0 - 7 |
| 4 | 0 - 15 |
| 5 | 0 - 31 |
| 6 | 0 - 63 |

red: Amount of red. (0 - 15)

green: Amount of green. (0 - 15)

blue: Amount of blue. (0 - 15)

Eg: SetRGB4(&my_screen->ViewPort, 2, 15, 15, 0); will change colour register 2 to be light yellow. (Red and green together will be yellow.)

ScrollRaster()

This function will scroll a rectangular area of a raster.

Synopsis: ScrollRaster(rp, dx, dy, minx, miny, maxx, maxy);

rp: (struct RastPort *) Pointer to the RastPort that

should be affected.

(long) Delta X movement. (A positive number moves dx: the area to the right, a negative number to the left.) (long) Delta Y movement. (A positive number moves dy: the area down, a negative number up.) (long) Left edge of the rectangle. minx: (long) Top edge of the rectangle. miny: (long) Right edge of the rectangle. maxx: maxy: (long) Bottom edge of the rectangle. Text() This function prints text into a Raster. Synopsis: Text(rast port, string, nr of chr); rast port: (struct RastPort *) Pointer to the RastPort that should be affected. string: (char *) Pointer to a text string that will be printed. nr of chr: (long) The number of characters that should be printed. WritePixel() This function will draw a single pixel. Synopsis: WritePixel(rast port, x, y); rast port: (struct RastPort *) Pointer to the RastPort that should be affected. (long) X position of the pixel. х: (long) Y position of the pixel. у:

B.4 EXEC LIBRARY

AllocMem()

This function allocates memory. You specifies what type and how much you want, and it returns a pointer to the allocated memory, or NULL if there did not exist enough memory.

Synopsis: memory = AllocMem(size, type);

memory: (void *) Pointer to the new allocated memory, or NULL if no memory could be allocated. Remember! Never use memory which you have not successfully

allocated.

size: (long) The size (in bytes) of the memory you want. (AllocMem() always allocates memory in multiples of eight bytes. So if you only ask for 9 bytes, Exec

would actually give you 16 Bytes (2*8).)

(long) You need to choose one of the three type: following types of memory (see chapter 0 INTRODUCTION for more information about Chip and Fast memory):

MEMF CHIP Chip memory. This memory can be accessed by both the main processor, as well as the Chips. Graphics/Sound data

MUST therefore be placed in Chip memory. If it does not matter what type of memory you get (Fast or Chip), you should try to allocate Fast memory before you allocate Chip memory. (Chip

memory is more valuable than Fast

memory.)

MEMF FAST Fast memory. This memory can only be accessed by the main processor. (Graphics and Sound data can NOT be stored in Fast memory, use Chip memory.) This memory is normally a little bit faster than Chip memory, since only the main processor is working with it, and

it is not disturbed by the Chips.

MEMF PUBLIC If it does not matter what type of memory you get (you do not intend to use the memory for Graphics/Sound data), you should use Fast memory. However, all Amigas do not have Fast memory, since you need to by a memory expansion in order to get it. If want to tell Exec that you would like to use Fast memory if there is any, else use Chip memory, you should ask for MEMF PUBLIC.

If you want the allocated memory to be cleared (initialized to zeros), you should set the flag ${\tt MEMF}$ CLEAR.

FreeMem()

This function deallocated previously allocated memory. Remember to deallocate all memory you have taken, and never deallocate memory which you have not taken.

Synopsis: FreeMem(memory, size);

memory (void *) Pointer to some memory which has previously been allocated. Remember! never use

memory which has been deallocated.

size (long) The size (in bytes) of the memory you want

to deallocate.

B.5 AMIGA DOS LIBRARY

Close()

This function closes an already opened file. Remember to close ALL files you have opened!

Synopsis: Close(file handle);

file_handle: (BPTR) Actually a pointer to a FileHandle

structure which has been initialized by a

previous Open() call.

CreateDir()

This function creates a new directory, AND "locks" is automatically. (Remember to unlock the directory later on.)

Synopsis: lock = CreateDir(name);

lock: (BPTR) Actually a pointer to a FileLock structure.

If lock is equal to NULL, AmigaDOS have not been

able to create the new directory.

name: (char *) Pointer to a string containing the name

of the new directory.

CurrentDir()

This function makes a specified directory "current directory". You need to lock the new directory (new_lock) before you can make it the current directory. The function returns the old current directories lock so you can unlock it if necessary.

Synopsis: old lock = CurrentDir(new lock);

old lock: (BPTR) Actually a pointer to a FileLock structure.

It is the old current directory lock.

new lock: (BPTR) Actually a pointer to a FileLock structure.

The new current directory lock.

DeleteFile()

This function deletes a file or directory. Remember that a directory must be empty before it can be deleted.

Synopsis: ok = DeleteFile(name);

ok: (long) Actually a Boolean. It is TRUE if AmigaDOS

could delete the file/directory, else FALSE which

means something went wrong. (Eg. disk write-

protected, directory not empty etc.)

name: (char *) Pointer to a string containing the name

of the file/directory you want to delete.

Info()

This function returns information about a specified disk. You specify which disk by either lock that disk, or a file/directory on that disk.

Synopsis: ok = Info(lock, info data);

ok: (long) Actually a Boolean. It is TRUE if AmigaDOS

could get information about the disk, else FALSE

which means something went wrong.

lock: (BPTR) Actually a pointer to a FileLock structure.

info data: (struct InfoData *) Pointer to an InfoData

structure which will be initialized by the Info() function. The problem with this structure is that it must be on a four byte boundary, so you need to use the function AllocMem() to get the right type of memory for the structure. (See Example.)

IoErr() This function can be used to get more information about an error message. Whenever you have used an AmigaDOS function which did not work properly (you have received an error message), you call this function and it will return an explanation. Synopsis: error = IoErr(); (long) This field contains a flag returned by error: IoErr() which can be: (I do not think I need to explain what they mean.) ERROR NO FREE STORE ERROR TASK TABLE FULL ERROR LINE TOO LONG ERROR FILE NOT OBJECT ERROR INVALID RESIDENT LIBRARY ERROR NO DEFAULT DIR ERROR OBJECT IN USE ERROR OBJECT EXISTS ERROR DIR NOT FOUND ERROR OBJECT NOT FOUND ERROR BAD STREAM NAME ERROR OBJECT TOO LARGE ERROR ACTION NOT KNOWN ERROR INVALID COMPONENT NAME ERROR INVALID LOCK ERROR OBJECT WRONG TYPE ERROR DISK NOT_VALIDATED ERROR DISK WRITE PROTECTED ERROR RENAME ACROSS DEVICES ERROR DIRECTORY NOT EMPTY ERROR TOO MANY LEVELS ERROR DEVICE NOT MOUNTED ERROR SEEK ERROR ERROR COMMENT TOO BIG ERROR DISK FULL ERROR DELETE PROTECTED ERROR WRITE PROTECTED ERROR READ PROTECTED ERROR NOT A DOS DISK ERROR NO DISK ERROR NO MORE ENTRIES Open() This function opens a file. Remember, before you can read/ write files you have to open them. file handle = Open(file name, mode);

file handle: (BPTR) Actually a pointer to a FileHandle

structure. If the system could not open the file with our requirements Open() returns NULL.

file_name: (char *) Pointer to a text string which contains

the file name including any necessary devices/

directories.

mode: (long) When you open a file you need to tell the

system what you are going to do with it. This field should therefore contain one of the

following flags:

MODE_OLDFILE: Opens an existing file for

reading and writing.

MODE NEWFILE: Opens a new file for writing.

(If the file already exist it

is deleted.)

MODE READWRITE: Opens an old file with an

exclusive lock. (The file is automatically locked with an

EXCLUSIVE LOCK.)

MODE READONLY: Same as MODE OLDFILE.

Read()

This function reads a specified number of bytes from a file.

Synopsis: bytes read = Read(file handle, buffer, size);

bytes read: (long) Number of bytes actually read. Even if

you tell AmigaDOS that you want to read x number of bytes, it is not certain that you actually can do it. The file is maybe corrupted,

not as big as you thought etc.

file handle: (BPTR) Actually a pointer to a FileHandle

structure which has been initialized by a

previous Open() call.

buffer: (char *) Pointer to the data buffer you want to

read the data into.

size: (long) Number of bytes you want to read.

Rename()

This function renames a file or directory. You can even move a file between directories by renaming it. (For example, Rename("df0:Documents/Sale.doc", "df0:Letters/Sale.doc"); will move the file Sale.doc from the directory "Documents"

to directory "Letters". Note! You can not rename a file from one volume to another.)

Synopsis: ok = Rename(old name, new name);

ok: (long) Actually a Boolean. It is TRUE if AmigaDOS

could rename the file/directory, else FALSE which

means something went wrong. (Eg. disk write

-protected.)

old_name: (char *) Pointer to a string containing the old

file/directory name.

new name: (char *) Pointer to a string containing the new

file/directory name.

Seek()

This function moves the "file cursor" inside a file:

Synopsis: old pos = Seek(file handle, new pos, mode);

old pos: (long) Previous position in the file, or -1 if

an error occurred.

file handle: (BPTR) Actually a pointer to a FileHandle

structure which has been initialized by a

previous Open() call.

new pos: (long) New position relative to the "mode".

mode: (long) The new pos can be relative to:

OFFSET_BEGINNING: Beginning of the file.
OFFSET_CURRENT: Current position.
OFFSET_END: The end of the file.

SetComment

This function attach a comment to a file or directory.

Synopsis: ok = SetComment(name, comment);

ok: (long) Actually a Boolean. It is TRUE if AmigaDOS

could attach the new comment, else FALSE which means something went wrong. (Eg. disk write-

protected.)

name: (char *) Pointer to a string containing the name

of the file/directory you want to attach the

comment to.

comment: (char *) Pointer to a string containing the

comment. (A comment may be up to 80 characters

long.)

bytes wr:

SetProtection() This function alters the protection bits of a file. You can set following flags: FIBF DELETE : the file/directory can not be deleted. FIBF EXECUTE: the file can not be executed. FIBF_WRITE : you can not write to the file. : you can not read the file. FIBF READ FIBF ARCHIVE : Archive bit. : Pure bit. FIBF PURE FIBF SCRIPT : Script bit. (Note! All of the flags are for the moment not working!) Synopsis: ok = SetProtection(name, mask); ok: (long) Actually a Boolean. It is TRUE if AmigaDOS could alter the protection bits, else FALSE which means something went wrong. (Eg. disk writeprotected.) (char *) Pointer to a string containing the name name: of the file/directory you want to change the protection bits. mask: (long) The protection bits. (For example, if you want to make the file/directory not deletable, and that it can not be executed you should set the protection bits: FIBF DELETE | FIBF EXECUTE.) UnLock() This function unlocks a previously locked file: (Remember to unlock ALL files you have locked!) Synopsis: Unlock (lock); (BPTR) Actually a pointer to FileLock structure lock: which has been initialized by a previous Lock() call. Write() This function writes a specified number of bytes to a file. Synopsis: bytes wr = Write(file handle, buffer, size);

(long) Number of bytes actually written. Even if

you tell AmigaDOS that you want to write x number of bytes, it is not certain that you actually can do it. Maybe the disk was full, write-protected etc.

previous Open() call.

buffer: (char *) Pointer to the data buffer which you

want to write.

size: (long) Number of bytes you want to write.

| | |

APTR *STRPTR Absolute memory pointer (Misdefined, use CPTR!)
SHORT short Signed 16-bit (WORD)
USHORT unsigned short Unsigned 16-bit (UWORD)

F GURU-MEDITATION

F.1 INTRODUCTION

If you have been programming the Amiga for a while you have most certainly seen your nice Amiga blow up in front of your eyes. However, the Amiga is a nice computer, and if it crashes it will try to do that as neatly as possible. You are usually (!) allowed to save any important files, and when the Amiga goes down it will give you a last message, trying to tell you what went wrong.

Many programmers have not realized how important that last message is. For them, it is just a collection of strange numbers. But those numbers can actually tell you what exactly went wrong, and once you know what went wrong, it is usually no problem to find the bug.

F.2 AMIGA CRASHING

When the Amiga is crashing it happens that the Exec have realized that something will go wrong and halted that task. Exec will then open a System requester with a warning message:

You can then save any important files to a disk before you answer the requester (once you have pressed CANCEL the Guru will visit you!). Important, since the Amiga is in trouble it can crash any second, and if you were saving anything onto a disk at that moment, the disk may become corrupted, and all data lost. The best solution is to have an empty emergency disk that you only use when the Amiga is upset. Sometimes the Exec have not been able to halt the task, and the Guru will immediately visit you.

F.3 GURU ALERTS

Once the Amiga really crashes, the powerlight will flash for some seconds, and an Alert will be activated. For example:

| Software failure! Press left mouse button to continue. | Guru Meditation #84010007.00C13870 |

Now you only need to decode the message and you have found the error. (Advanced programmer can attach a modem to the Amiga and use a program called ROMWack in order to debug the computer. But we will not discuss it here.)

F.4 GURU MEDITATION NUMBERS

There exist two different types of Guru Meditation Numbers:

- CPU Errors (680x0 Processor Traps)
- System Software Errors

F.5 CPU ERRORS

CPU Errors look like this:

Guru Meditation #0000000x.yyyyyyyy

x is one of the following values:

2 Bus Error Hardware error

3 Address Error Word access on odd byte boundary

4 Illegal Instruction

5 Divide by zero

6 CHK Instruction

7 TRAPV Instruction

8 Privilege Violation

9 Trace

A $\,$ Opcode 1010 Emulation $\,$ Instruction word with a value

between A000-AFFF.

B Opcode 1111 Emulation Instruction word with a value

between F000-FFFF.

yyyyyyyy is the address of the task which went wrong. (It is normally your own program that caused the problem.)

If you get a Guru Meditation number like #0000005.00C13870 it means: A program, at the address C13870, tried to devide a value by zero. Since you now know what the error was you only need to look at the places where your program can be forced to devide a value by zero, and it should not take to long time to find the bug.

F. 6 SYSTEM SOFTWARE ERRORS

System Software errors look like this:

Guru Meditation #aabbcccc.dddddddd

The first field of the number tells us if the error is a Recoverable Error or if it is a Dead End Alert. If the error is a Dead End Alert the number will start with 8 otherwise it is 0. (The total screen will also be black, while on Recoverable Errors the screen is merely pushed down a bit.)

The first field of the number tells us also which Device, Library or Resource went wrong:

| 01 | Exec Library | LIBRARIES |
|-----|---------------------|-----------|
| 02 | Graphics Library | |
| 03 | Layers Library | |
| 04 | Intuition Library | |
| 05 | Math Library | |
| 06 | CList Library | |
| 07 | AmigaDOS Library | |
| 8 0 | RAM Handler Library | |
| 09 | Icons Library | |

- 10 Audio Device DEVICES
- 11 Console Device
- 12 GamePort Device
- 13 Keyboard Device
- 14 Trackdisk Device
- 15 Timer Device
- 20 CIA Resource RESOURCES
- 21 Disk Resource
- 22 Misc Resource
- 30 BootStrap OTHERS
- 31 Workbench
- 32 Disk Copy

A number like 04 means: Recoverable Error in the Intuition Library. While a number like 84 means: Fatal Error in the Intuition Library.

The second field (bb) of the Guru Meditation number gives us the general cause of the problem:

- 01 No Memory
- 02 Unable to Create Library
- 03 Unable to Open Library
- 04 Unable to Open Device
- 05 Unable to Open Resource
- 06 Input/Output (I/O) Error

07 No Signal

So a number like 8201cccc means a fatal error in the Graphics Library, the problem was caused by not enough memory.

The last field (cccc) before the dot gives some more specific information. Here is a list of some common Guru Meditation Numbers: (This information is taken form the headerfile

```
"exec/alerts.h" [V1.3]:)
Exec Library:
  01000000
  81000001 68000 exception vector checksum
  81000002 Execbase checksum
  81000003 Library checksum failure
  81000004 No memory to make library
  81000005 Corrupted memory list
81000006 No memory for interrupt servers
  81000007 InitStruct() of an APTR source
  81000008 A semaphore is in illegal state
  81000009 Freeing memory already freed
  8100000A Illegal 68k exception taken
Graphics Library:
  02000000

8400000C Bad State Return entering Intuition

8400000D Bad Message received by IDCMP 8400000E Weird echo causing incomprehension 8400000F Couldn't open the Console Device Amiga DOS Library: 07000000 07010001 No memory at startup 07000002 EndTask didn't 07000003 Qpkt failure 07000004 Unexpected packet received 07000005 Freevec failed 07000006 Disk block sequence error 07000007 Bitmap corrupt 07000008 Key already free 07000009 Invalid checksum 0700000A Disk Error 0700000B Key out of range 0700000C Bad overlay RAM Library: 08000000 08000001 No overlays in library seglists Trackdisk Device: 14000000 14000001 Calibrate: seek error 14000002 Delay: error on timer wait Timer Device: 15000000 15000001 Bad request 15000002 Power supply does not supply ticks Disk Resourcek.resource: 21000000 21000001 Get unit: already has disk 21000002 Interrupt: no active unit BootStrap: 30000000 30000001 Boot code returned an error The number after the dot (dddddd dd) can be three things: 1. Address of the task which went wrong. 2. If the error occured because of some sort of memory

- If the error occured because of some sort of memory allocation/deallocation, it is the address of that memory block.
- 3. If Exec is realy confused the number is 48454C50, which stands for HELP. (48=H, 45=E, 4C=L, 50=P)

G OPERATORS

H ADDITIONAL EXAMPLE SOURCES

H.1 INTRODUCTION

The following additional source code examples can be found in the original ACM package, incl. referenced data files.

http://aminet.net/package/dev/c/ACM

H.2 COLOURWINDOW

ColourWindow is the first and only true colour requester in the Public Domain. It adjust itself to any depth (2, 4, 8, 16 or 32 colours), and can be used with high- as well as low resolution screens. Everything is done by the rules, and this program will return everything it has taken, and use a minimum of processing time. It is yet another program releaced from the Amiga C Club!

H.3 EASYSOUND

Now at last you can easily write C programs that plays digitized sound. You simply use four functions that will take care of all the work of allocating memory, loading the files, opening the ports and reserving the sound channels. Despite the simplicity you can still decide what volume and rate, which channel, and how many times the sound should be played. The functions contain full error checking, and will close and return everything that have been taken.

H.4 FILEWINDOW

The reason why I created FILE WINDOW was that I never more wanted to see that old stupid "Please type in filename:" prompt. It is a disgrace for any program to use it, and VERY annoying for the user.

REMEMBER, one of the first things the user will see of your program is the file requester. If you want your program to make a good impression, and look solid, I would recommend you to use a good file requester.

FILE WINDOW is written to be as easy as possible to use, and is fully amigaized.

H.5 INPUT

H.5.1 JOYSTICK

Joystick() is a handy, easy and fast but naughty function that hits the hardware of the Amiga. It looks at either port 1 or port 2, and returns a bitfield containing the position of the stick and the present state of the button.

H.5.2 KEYBOARD

Keyboard() is a handy, easy and fast but naughty function that hits the hardware of the Amiga. It checks the keyboard, and returns the Raw Key Code. (See chapter (C) SYSTEM DEFAULT CONSOLE KEY MAPPING for the full list of Raw Key Codes.)

H.5.3 MOUSE

Mouse() is a handy, easy and fast but naughty function that hits the hardware of the Amiga. It looks at either port 1 or port 2, and returns the (x and y) delta movement of the mouse, as well as a bitfield containing the present state of the three buttons. (A normal Amiga mouse has only two buttons (left and right), but it is possible to connect a mouse with three buttons, so why shouldn't we support it?)

H. 6 HACKS

H.6.1 COPPER

This program demonstrates how to play with the Copper.

H.6.2 LED

This fantastic useful program does what all true hackers have dreamt of. Enjoy your Amiga's fantastic ability to flash one LED!

H.7 TOOLS

H.7.1 P2C

This program prints out the Sprite Data of the pointer. It can also print out the colours, and/or a SimpleSprite structure.
